DETAILED ACTION

Reasons for Allowance

1. The following is an examiner's statement of reasons for allowance: In response to the final office action dated August 01, 2008, and further in view of applicant's amendments filed on 10/22/08, and a request to reconsider the application in view the amendments has been carefully reviewed and respectfully considered.

Claims 15-17 have been rejected under 35 USC 103(a) as being unpatentable over Saito et al. (US 6,343,162) in view of Kurata et al. (US 4,518,999), as indicted in the previous Office action. And, those claims (15-17) are now canceled by applicant as indicated in the applicant's response. Claims 2 and 4 also cancelled previously, and the remaining (pending) claims 1, 3, 5-14, 19 and 18, which were allowed in the last office action are now fully considered and are in condition for allowance for the reasons given below:

With respect to claims 1, 3 and 18, the prior art searched and of record neither anticipates nor suggests an image sensor comprising: a transparent cover having a first surface on an image reading region side, and a second surface away from the first surface; a light source throwing light to the image reading region from a second surface side of the transparent cover; and a plurality of light receiving elements each receiving reflected light from the image reading region and outputting an image signal corresponding to an amount of the light received; wherein the transparent cover

Art Unit: 2625

includes a transparent main body of a synthetic resin, and a transparent glass member corresponding to the image reading region, wherein the transparent main body has a groove corresponding to the image reading region, the transparent glass member being placed in the groove; and wherein the transparent main body and the transparent glass member each have a surface which is flush with each other and provide the first surface.

As to claims 5-14 and 19, claims are allowed for the reasons the prior art searched and of record neither anticipates nor suggests an image sensor comprising: a transparent cover having a first surface on an image reading region side, and a second surface away from the first surface; a light source throwing light to the image reading region from a second-surface side of the transparent cover; and a plurality of light receiving elements each receiving reflected light from the image reading region and outputting an image signal corresponding to an amount of the light received; wherein the transparent cover includes a transparent main body of a synthetic resin, and a transparent glass member corresponding to the image reading region, wherein the transparent main body has a groove corresponding to the image reading region, the transparent glass member being placed in the groove, wherein the transparent glass member is exposed on a surface side, and wherein in the image reading region is linear, the transparent cover having a nontransparent region corresponding to an end portion of the image reading region.

Art Unit: 2625

Therefore, claims 1, 3, 5-14, 18 and 19 are Allowed for the reasons the claimed invention are distinct from the prior art searched and of record neither anticipates nor suggests the claimed invention.
